
Bruise

A revolutionary injury detection suit for paraplegic athletes

Lucy Jung, Elena Dieckmann, Ming Kong, Daniel Garrett

Sit-skiing, wheelchair basketball, and ice sledge hockey are fast paced, high-performance, high-adrenalin sports, but don't come without their risks. Paraplegic athletes often suffer undiagnosed injuries in the parts of their body with reduced sensation. Untreated injuries can develop into performance-hindering or even life-threatening conditions. **Bruise** is a smart injury detection suit, which uses a recyclable pressure-sensitive film to indicate the severity of injuries by changing colour upon impact. **Bruise** is made of sweat-wicking stretch fabric for a comfortable, supportive fit. Mesh inserts and ergonomic seams offer breathability and freedom for movement.
